

Foundation for Apps Packaged for Meteor (scss only)

meteor add rainhaven:foundation-apps

To use this package you'll need to create a scss file in your app and import foundation from the build directory. The path will very depending on your app's name. For my test app, the path looked like this:

@import ".meteor/local/build/programs/server/assets/packages/rainhaven_foundationapps/foundation";

If you want to use Foundation's settings file to override the default settings, you'll need to copy the _settings.scss file—from the root of this package—into your app, and import it into your scss file before the foundation import.

@import "base/settings";
@import ".meteor/local/build/programs/server/assets/packages/rainhaven_foundationapps/foundation";
